The inside cover picture, provided by Cirujano and co-workers, illustrates the results of their work on recycling catalytic amounts of Pd(OAc)₂ in the presence of redox active, stable and reusable metal-organic microporous frameworks (MOF-74), thus achieving the C-H functionalization of pharmaceutically interesting aza-heterocycles with alkenes.

A unified total synthesis of stemoamide-type alkaloids is reported. Our synthetic approach features the chemoselective convergent assembly of five-membered building blocks via stemoamide as the common precursor to tetracyclic natural products.

The word "enamine" is derived from the affix en-, used as the suffix of alkene, and the root amine. This can be compared with enol, which is a functional group containing both alkene (en-) and alcohol (-ol). Enamines are considered to be nitrogen analogs of enols. If one of the nitrogen substituents is a hydrogen atom, H, it is the tautomeric form of an imine.

Sodium triacetoxyborohydride is presented as a general reducing agent for the reductive amination of aldehydes and ketones. Procedures for using this mild and selective reagent have been developed for a wide variety of substrates.

In organic chemistry, an alkene is an unsaturated hydrocarbon that contains at least one carbon-carbon double bond. The words alkene and olefin are often used interchangeably (see nomenclature section below). Acyclic alkenes, with only one double bond and no other functional groups, known as mono-enes, form a homologous series of hydrocarbons with the general formula C_nH_{2n}.

The inherent specificity and electrochemical reversibility of enzymes poise them as the biorecognition element of choice for a wide range of metabolites. To use enzymes efficiently in biosensors, the redox centers of the protein should have good electrical communication with the transducing electrode, which requires either the use of mediators or tedious biofunctionalization approaches.

From the beginning of widespread electricity use, coal has fueled, and continues to fuel, the largest share of worldwide electric power production, and coal consumption has increased significantly over this period and is expected to continue increasing.

Old target, new tricks: A total synthesis of the infamous polycyclic indole alkaloid reserpine has been accomplished. The synthetic strategy features a rationally designed internal asymmetric desymmetrization process, which renders the use of a greatly simplified reserpine E ring compared to all the past syntheses.

By Bill Kohlhaase for Planet Natural. When U.S. District Judge for New York Naomi Buchwald threw out a lawsuit in February filed by The Organic Seed Growers and Trade Association (OSGATA) and dozens of other plaintiffs against the Monsanto Corporation, she struck a blow against organic growers, small farmers and concerned citizens across the country.
